

Memory

Types of Memories

Type	What It Does	Analogy
Sensory Memory	Takes in sights, sounds, and smells for 1–2 seconds.	A camera flash — quick and temporary.
Short-Term (Working) Memory	Holds around 5–7 items for ~30 seconds while you use them.	A sticky note on your desk.
Long-Term Memory	Stores facts, skills, and deep memories forever.	A giant, infinite hard drive .

Hippocampus

- The "save button"
- It sits deep in the brain
- processes short term memories
- short term → long term

Pre-Frontal Cortex

- The "working desk."
- Located behind forehead
- Manages working memory,
- focus
- decision-making while solving a problem.

Amygdala

- The "emotional tagger."
- Attaches strong feelings to memories,
- Makes emotional events easier to remember.

Neuroplasticity

- Neurons & Synapses: 86 billion special cells = neuron
- They pass electrical and chemical signals across tiny gaps called synapses.
- Building Synaptic Pathways: Every time you learn or recall something, electricity travels down a path between neurons.

Activity! *all*

Stand far away from the bucket.

Toss 5 papers into the bag using only your non-dominant hand (your non-writing hand!).

Activity!

all

- Step close to the bucket.
- Toss 10 papers in a row into the bag.

3 Stages of Memory

- Encoding: Turning senses into electrical signals
(no attention = no encoding)
- Consolidation (Storage): Strengthening brain pathways (happens mostly in REM/Deep Sleep)
- Retrieval: Fetching stored info (opens memory up to be edited or strengthened)

Forgetting

- Trace Decay: Unused brain paths get pruned (cleaned up) to save energy

Interference Theory:

- Proactive: Old info blocks new info (Ex: writing last year's date in January)
- Retroactive: New info wipes out old info (Ex: new password makes you forget the old one)

Activity!

all

- Round 1 (Group A): Read the words out loud as fast as possible
- Round 2 (Group B): Say the INK COLOR out loud—ignore the written word!
